for  $n = 3 \hat{1} + 1$  are called  $K\hat{1}^2$  x-rays. The energy efficiency of this process is only about 0.1%, most is lost in heat. Two of the most common elements used to create x-rays in this fashion are copper and molybdenum. The alternative is to use x-ray radiation from synchrotrons, which are usually linear electron accelerators combined with storage rings.
