It is organized into two parts. In Part 1 the reader will learn how to model network problems appearing in computer networks as optimization programs, and use optimization theory to give insights on them. Four problem types are addressed systematically – traffic routing, capacity dimensioning, congestion control and topology design.

another. Consequently the design issues in a network need to use the optimized parameters to deliver quality of service. This paper attempts to find a mathematical model for optimization of a computer network. 1. Introduction The development of computer networks has given rise to the Internet, where millions and millions of data bytes are transferred every second.

He also lectures in network optimization and planning courses for computer networks. He is the author or co-author of more than 100 journals and conference papers, and he is the originator of the Net2Plan open-source initiative which includes the Net2Plan tool and public repository of algorithms and network planning resources ([www.net2plan.com](http://www.net2plan.com)).

The Gordan-Newell network model is illustrated in the Fig. 1 below. The number of states of the network increase rapidly with  $n$ . If the number of packets accessing the nodes of the network is  $n=2$ , the number of states will be 6 distributed among the three nodes, the states are:  $(2,0,0), (1,1,0), (0,2,0), (1,0,1), (0,0,2), (0,1,1)$ .

for multiobjective optimization, with emphasis on applications to data networks. Problems with two objectives are considered first, called bicriteria optimization problems (treated in Sections I and II). The main concepts of bicriteria optimization naturally extend to problems with more than two objectives, called multicriteria optimization problems.
